General Information

Introduction

This manual contains installation, operation, and maintenance instructions for the Chandler Engineering Model 5265 Static Gel Strength Cement Analyzer.

Description

The 5265 Static Gel Strength Cement Analyzer (SGSA) is an instrument that measures the static gel strength of API cement under high temperature and high-pressure conditions. The instrument captures ultrasonic signals that are passed through the sample then performs post-processing of the data to determine the static gel strength (SGS) versus time plot.

Each 5265 autoclave connected as part of the SGSA system is equipped with an internal processor board that sends and receives an ultrasonic pulse through the slurry, performs digital signal processing of captured data and, as an option, measures the transit time of the pulse through the slurry.

After the processor board computes the SGS data, it is sent to the I/O board located on the rear of the autoclave. The I/O board is connected to the RS-232 serial communication port located on the rear of the PC or to another autoclave I/O board by a four-wire RS-485 communication cable.

Additionally, as an option, the instrument may be used to determine the compressive strength of the cement using the same algorithms and method found in the Model 4265 Ultrasonic Cement Analyzer (UCA).

Features and Benefits

The major features of the 5265 Static Gel Strength Analyzer (SGSA) are listed below:

- Easy to install and use.
- Uses PC based Chandler Model 5270 Data Acquisition System for data retrieval, analysis and storage.
- Tests stored in database may be sorted and retrieved based on user specified data base fields.
- Built-in pump and relief valve for sample pressure control.
- Optional cement compressive strength measurement (UCA).
- Optional external chiller system.
# Specifications

### Environmental and Utility

- **Environment:** Indoor use, altitude up to 6562ft (2000m)
- **Ambient Temperature:** 60-122°F (16-50°C)
- **Storage Temperature:** 41-122°F (5-50°C)
- **Operating Temperature Range:** 41-122°F (5-50°C)
- **Max Relatively Humidity:** 80% RH for temperatures up to 88°F (31°C) decreasing linearly to 50% RH at 104°F (40°C)
- **Compressed Air:** 50-100 psi (340-690 kPa)
- **Pressurizing Water:** 5-150 psig (.34-10.4 bar)
- **Cooling Water/EG solution:** 20-80 psi (138-552 kPa)
- **Drain:** Suitable for hot water/steam up to 400°F (204°C)
Safety Requirements

READ BEFORE ATTEMPTING OPERATION OF INSTRUMENT

If this equipment is not used in a manner consistent with the manufacturer’s specifications the protection provided by the equipment may be impaired.

Warning: Read before attempting operation of this instrument. This instrument is capable of high temperatures and pressures and must always be operated with CAUTION. The instrument is designed for operator safety. To ensure that safety, it is essential the general instructions outlined below are followed. This instrument should only be operated by trained personnel that have completed the appropriate safety training.

Warning: High Temperatures
During a test, the instrument can become hot and cause injury if touched. Allow the cylinder to cool to below 95°F (35°C) prior to touching.

The following safety procedures are advisable:

- Post signs where the instrument is being operated to warn other personnel.
- Read and understand the instructions and caution notes before attempting operation.
- Never exceed the instrument maximum pressure and temperature ratings. The particular safety requirements associated with the handling and use of the medium to be tested, especially the additional requirements associated with handling potentially flammable liquids or otherwise hazardous agents are the responsibility of the customer – proper precautions must be taken to reduce the risk of fire or explosion.
- Use appropriate Personal Protective Equipment such as safety glasses, latex gloves, etc.
- This is a bench top device; place the instrument on a suitable, level, and stable surface.
- Locate the instrument in a low traffic area. Allow a minimum of 12 in. (305mm) unobstructed clearance around side, back and top faces to provide for adequate ventilation. Position the back of the instrument to allow access to disconnect cords in the event of an emergency.
- Always disconnect main power to the instrument before attempting any repair.
- Have the safety officer at your location review the safety aspects of the instrument and this manual and approve the operational and installation procedures.
- Turn off the heater at the completion of a test. Hot water in the open cylinder or drain, when exposed to the atmosphere and heated beyond its boiling point, can cause severe burns from steam.
• A fire extinguisher, type 8 BC, should be located within 50 feet (15 meters) of the instrument.

Before attempting to operate the instrument, the operator should read and understand this manual.

Where to Find Help

In the event of problems, contact your local sales representative or Chandler Engineering:

- Telephone: 918-250-7200
- Fax: 918-459-0165
- E-mail: chandler.sales@ametek.com
- Website: www.chandlereng.com

Instrument training classes are also available.
This page is intentionally left blank.
Section 1 – Installation

Unpacking the Instrument

File an insurance claim with your freight carrier if damage has occurred during shipping. Verify all parts shown on the enclosed packing list have been received. If items are missing, immediately notify Chandler Engineering.

Re-configuration

1. Apply power to the instrument.
2. Make sure the instrument is connected to serial port COM1 on the host computer.
3. Turn ON the power to the instrument.
4. Each data channel on each instrument must have a separate address. The DIP switches at the rear of the instrument are used to configure the data channels. During normal operation each of the four switches must be set to the OFF position. During configuration of the address for the SGSA, temperature, or pressure channels, the DIP switches on the autoclave must be set according to the table below.

<table>

</tr>
</tbody>
</table>
Connecting Serial Power

Use the configuration software (SIXBCCD.EXE) to configure the individual data channel addresses.

A basic schematic for connecting one autoclave to another is shown in the following figure.

One autoclave in each 5265 SGSA system must be connected to serial port COM1 on the host computer using a standard 25 pin male to 25 pin female or 25 pin male to 9 pin female RS-232 serial cable, depending on the computer.
Section 2 – Operating Instructions

Front Panel Controls

The figure below shows the front panel and all the associated controls. The description of each control will follow the figure.

Air Inlet Gauge

This gauge displays the pressure of the air supply connected to the autoclave. The pressure should be between 50 and 100 psig (340 and 690 kPa) when the pump is not in use.

Pump Pressure Adjust Regulator

This regulator is used to control the pressure of the air supplied to the pump.

Pump Air Pressure Gauge

Indicates the pressure of the air supplied to the pump. Each 5 psig (35.5 kPa) pressure applied to the pump results in approximately a 1000 psig (7000 kPa) hydraulic pressure output from the pump.

Relief Valve

The relief valve or back-pressure regulator may be used to set the upper limit on the system pressure up to 10,000 psig (69,050 kPa). Turn the relief valve knob clockwise to increase pressure and counterclockwise to reduce pressure. To configure the pump and relief valve to control pressure automatically will be discussed in the section titled Pressure Control, discussed later in the section.
Verification of Signal Strength

You can verify the proper signal strength by running the following test:

1. Set up instrument to run a water test.
   - Starting temperature: Room temperature
   - Initial Pressure: 1,000 psig
2. Fill slurry cup with water.
3. Run test.
4. Initial gel value should be between 7000 – 7500.
5. If the initial gel value does not fall within these parameters, disassemble, inspect and clean if necessary the transducer and end cap.
6. Rerun test.

Running a Test

Relief Valve Shut-off

The relief valve is only usable up to pressures of 10,000 psig. If it is necessary to operate the autoclave at pressures above 10,000 psig, the RELIEF VALVE SHUTOFF must be turned clockwise to the closed position.

Note: Closing the relief valve shutoff valve will also isolate the internal pressure transducer. The pressure transducer will not measure pressures above 10,000 psig (69,050 kPa).

Pump Switch

Opens or closes a solenoid valve which controls the flow of air to the pump. Turning this switch to the ON position causes the pump to increase pressure in the test cell. Turning the switch to the OFF position stops the pump from operating.

Pump Water Switch

This switch is used to control the flow of water to the pump and test cell. This switch must be OFF any time the test cell is not installed. This switch must be ON to fill the tubing connected to the test cell with water or to operate the pump.

Coolant Switch

Used to control the flow of coolant to the heating/cooling jacket. This switch must be OFF during a test, but should be turned ON following a test to cool the heater and test cell.

If the optional chiller is used, the coolant switch has three settings: ON, OFF, AUTO. The ON setting circulates chilled fluid through the heating/cooling jacket, the OFF setting disables the heating/cooling feature, and the AUTO setting allows the temperature controller to control the chiller. After the cool-down segment of a temperature profile is complete, it is recommended to place the
coolant switch in the OFF position to avoid possible temperature oscillations at temperatures above room temperature.

**Pressure Release Valve**

Used to manually release pressure from the test cell. Valve must be closed during testing except when it is necessary to manually release pressure. Valve must also be closed when removing test cell with cooling water ON or else a significant water leak will occur.

**Cylinder Pressure Gauge**

Displays the pressure inside the test cell.

**Temperature Controller**

Used to control the temperature in the test cell.

**Heater Switch**

Used to turn the flow of current to the heater ON or OFF. Switch must be in the ON position during testing and should be in the OFF position as a safety precaution at other times.

**Main Power Switch**

Used to turn the 220VAC power to the heater and internal solenoid valves instrument ON or OFF. Switch must be in the ON position during testing.

**Instrument Power Switch**

Used to turn the power to the internal instrumentation ON or OFF. Switch must be in the ON position during testing. The instrument power may be connected to an uninterruptible power supply (UPS) if desired.

**Left Rear Panel**

The left rear panel contains all the connections for the cables that connect the autoclave to the processor. This panel also contains connections for the top transducer, the thermocouple, the main power, and the fuses.

**Data Cable Connector**

This connection is not used on the 5265 Autoclave.

**Ref Cable Connector**

This connection is not used on the 5265 Autoclave.
Monitor Cable Connector

This connector is used for monitoring the ultrasonic signals within the test cell. Normally it is not used. It may be used during system testing.

Top Transducer Connector

The coaxial cable attached to the top transducer must be mated to this connector prior to beginning a test.

J Thermocouple Connector

The thermocouple that is attached to the top plug must be plugged into this connector prior to the beginning of a test and any time that it is necessary for the temperature controller to operate. If the thermocouple is not connected, the temperature controller will display “SBr” and will not function.

Main Power Connection

Located beside the fuses, it requires a twist lock plug to connect the power. The power required will be 208-240 VAC, 10A.

Fuses

There are two fuses (2.5A, 250VAC) located in the Instrument Power Receptacle. To check these fuses, remove the power cord and pry off the access panel with a small screwdriver.

Right Rear Panel

The right rear panel contains all the connections for hydraulic and pneumatic utilities.

Air Inlet, Pump Water Drain/Inlet

These connectors are used to connect the pneumatic and hydraulic utilities.

High Pressure Inlet (optional)

This high-pressure connector exists so that pressure may be controlled with an alternate pressure control system.
Operating the Instrument

1. Install the Model 5270 Data Acquisition Software in accordance with the instructions found in the software manual.

2. Connect power to the instrument using the cord and twist-lock connector supplied with the autoclave. It is recommended that each individual autoclave be connected to a separate circuit breaker or fuse. A 15A fuse or circuit breaker is recommended. A separate power input exists for the internal electronics. This arrangement permits the use of an uninterruptible power supply (UPS) to protect the data acquisition electronics and test data from brief power failures.

3. Connect the coolant to the connector labeled COOLANT INLET on the rear panel of the instrument as shown previously. The fitting is a 1/4-inch female NPT fitting. If water is used for cooling, the water must be clean and free of debris that could cause failure of the pump or relief valve. If in doubt, a water filter is recommended.

4. If the optional chiller is being used, connect the outlet port of the chiller system to the COOLANT INLET port and the COOLANT DRAIN port to the chiller inlet port. Configure the chiller to operate at the minimum set point temperature (41°F, 5°C).

5. Connect the pressurizing water to the connector labeled PUMP WATER INLET on the rear panel of the instrument as shown previously. The fitting is a 1/4-inch female N.P.T. fitting. The water must be clean and free of debris that could cause failure of the pump or relief valve. If in doubt, a water filter is recommended.

6. Connect the water drain line to the connector labeled PUMP WATER DRAIN on the rear panel of the instrument as shown previously. If water is used as a coolant, the COOLANT DRAIN may also be connected to the water drain line. If an external chiller is used, the COOLANT DRAIN is connected to the chiller return. The fittings are 1/4-inch female NPT fittings.

The drain system must be capable of handling hot water up to 212°F (100°C) or brief surges of up to 400°F (204°C) steam for short periods of time during initial cooling of the instrument. If two or more autoclaves are connected to a common drain line, it is recommended that the common drain be 3/8-inch (10mm) inside diameter, minimum. It is also recommended that the drain system be all metal. Copper tubing with brass fittings is satisfactory.

7. Connect the air supply to the connector labeled AIR INLET on the rear panel of the instrument. The fitting is a 1/4-inch female N.P.T. fitting. The air should be dry and relatively free from dirt and oil. The air should be supplied at a pressure of 50-100 psi (340-690 kPa). Compressed nitrogen may also be used in place of the compressed air if necessary.
Preparing the Sample and Cell for a Test

The recommended procedure for preparing the test cell and slurry for testing are outlined in the following steps:

1. Always check the sealing components to make sure they are clean and in good condition. If the O-rings are deformed or hardened replace them.
2. Apply a light coating of lithium grease to the inside cylinder and threads and also to each plug. Avoid apply grease on the flat face of the plug and base as this will affect the transducer signal. This will prevent cement from sticking to the metal and will make cleanup easier.

*Note:* The test cylinder is tapered from top to bottom, with the smallest diameter at the top. This is to facilitate removal of the cement sample from the test cell. The top of the cylinder is denoted by the letter $T$ stamped on the wrench flat on the top end of the cylinder.

3. Place the bottom plug in a vice. Install seal ring and O-ring. Apply a thin coat of high temperature grease on the O-ring and sealing ring.
4. Screw the cylinder onto the bottom plug located in the vise with the cylinder end marked $T$ at the top. It is recommended that the plug be screwed in by hand and that the plug be tightened so that it just contacts the cylinder. Further tightening after the plug has contacted the cylinder will not cause more effective sealing, and will cause plug removal difficulty.
5. Install the transducers in the top and bottom plug using the spring and transducer support plug. Always place a thin coating of high temperature ultrasonic couplant on the sensor each time it is removed. Use the couplant sparingly. Excessive buildup of couplant can lead to instrument malfunction.
6. Mix the slurry for the test in accordance with API Spec 10 procedures. Approximately 200 mL of slurry is required to fill the cell.
7. Pour approximately 200cc of cement slurry into the greased test cell. Be careful not to get cement into the threads. If cement sets up in the threads it may make plug removal and installation difficult.
8. Continue to pour cement in test cell until level is 1/4 inch (6mm) below the circular lip in the cylinder. Use the Slurry Level Gauge to obtain the proper fill level. The slurry should touch the lower tab marked WET but not touch the upper tab marked DRY. Do not overfill the test cell, or cement will be forced into the pressure and/or thermocouple ports, and plug them.

9. Use a small amount of water to continue filling the cell up to the water fill line indicated on the slurry level gauge.

10. Screw the top plug into the top of the cylinder. It is recommended that the plug be screwed in by hand and that the plug be tightened so that it just contacts the cylinder. Further tightening after the plug has contacted the cylinder will not cause more effective sealing, and will cause plug removal difficulty.

11. The test cell is ready to be installed in the heating jacket.

12. Wipe the cylinder assembly clean and place in autoclave chamber. Carefully guide the bottom transducer cable through the bottom of the heater assembly and out the front panel of the instrument. Be certain that the cylinder is not sitting on the cable. Do not crimp the cable in any way since it can change the signal characteristics. Connect the cable to the connector on the front panel.

13. Align the pressure port in the top plug with the high-pressure filter on top of the autoclave assembly. Rotate the cell clockwise to align.

14. Position the filter with the arrows (located on the side) pointing in the downward position and attach the short end of the U-tube connection to the top of the filter, as shown in the picture.

15. Attach the filter assembly into the bulkhead located on top of the instrument.

16. Connect the longer end of the tube into the top of the cylinder. Hand-tighten initially to start the threads, then use a 5/8” wrench to tighten.

17. Connect the top transducer cable to the BNC connector labeled Top Transducer at the back of the autoclave.

18. Install the thermocouple in the other high-pressure port in the top plug. Hand-tighten only.

19. Connect the thermocouple cable to the receptacle labeled J Thermocouple at the back of the autoclave.

20. Turn ON the water supply switch until water exits the thermocouple vent hole. Tighten the thermocouple connection using a 5/8-inch wrench.

Note: Use a rag or paper towel to catch water that exits the thermocouple vent.

21. The test cell and autoclave are now ready to begin a compressive strength test.

Running a Test

This section describes the steps used to control pressure and temperature in the 5265 autoclave.

Pressure Control

Follow the steps below to configure the pump and relief valve for automatic pressure control.
1. Make certain the test cell is installed properly, the HIGH PRESSURE INLET port on the rear of the instrument is plugged, the PUMP switch is in the OFF position, the PUMP WATER valve is turned to the ON position, and the instrument is supplied with compressed air.

2. Turn the PUMP PRESSURE ADJUST regulator clockwise until air pressure is sufficient to raise pressure to the desired pressure set point. Each 5 psig (34.5 kPa) air pressure results in approximately 1000 psig (6895 kPa) hydraulic pressure. The air pressure should not exceed 100 psig (690 kPa). Note that the pump may not be capable of achieving pressures in excess of 16,000 psig without using heat to expand the fluid and increase pressure.

3. Turn the Relief Valve knob clockwise until the release pressure is sufficient to prevent the relief valve from opening at the desired pressure set point.

4. Turn the PUMP switch to the ON position until pressure exceeds the desired set point. Turn the PUMP switch to the OFF position. Make certain the system is holding pressure before proceeding.

5. Turn the Relief Valve knob counterclockwise slowly until the test cell pressure begins to drop. Continue turning the regulator knob slowly until the pressure in the test cell equals the upper limit of the desired test pressure.

6. Turn the PUMP PRESSURE ADJUST regulator counterclockwise until the air pressure is approximately zero.

7. Turn the PUMP switch to the ON position.

8. Slowly turn the PUMP PRESSURE ADJUST regulator knob clockwise until the pump begins to stroke. Continue to slowly turn the regulator knob clockwise until the lower limit for the control pressure is achieved. Note that failure to apply any pressure to the slurry may result in a loss of transit time signal through the slurry.

**Temperature Control**

Refer to the 8050/8051 Temperature Controller Manual for information on how to program and operate the temperature controller. When the controller has been programmed and the Processor is operating properly, the test may be started by turning the HEATER switch to the ON position and selecting CM.1=AUTO on the temperature controller.

1. If the chiller is being used, place the coolant switch in the AUTO position. After the cool-down segments of a temperature profile are complete, it is recommended to place the coolant switch in the OFF position to avoid possible temperature oscillations at temperatures above room temperature.

2. To end the test, turn the HEATER switch to the OFF position.

3. Turn the Temperature Controller OFF by pressing the Advance button so that the controller displays CM.1 and pressing the up or down arrow buttons to select OFF.

*Note: Always leave the controller in the OFF mode with the HEATER switch turned OFF when the thermocouple is not installed in the cylinder.*

**Ending a Test**

1. Turn ON the COOLANT switch to cool the test cell. Monitor the test cell temperature using the Temperature Controller. Use the pump to maintain pressure on the test cell until the cell is cool. When the temperature is below 200°F (93°C) the pump switch may be turned to the OFF position and the PRESSURE RELEASE valve turned to the open position. Failure to maintain
pressure at temperatures above 212°F (100°C) may cause water in the test cell to become steam.

2. Turn the PUMP WATER switch to the OFF position.
3. Turn MAIN POWER and INSTRUMENT POWER switches OFF.
4. Close the PRESSURE RELEASE valve (clockwise). Failure to do so will result in water leakage when the U-tube or thermocouple is loosened.
5. Remove the U-shaped high-pressure tubing connecting the test cell to the high-pressure filter on the autoclave assembly.
6. Disconnect the top sensor cable.
7. Disconnect the bottom sensor cable from the front panel.
8. Remove the thermocouple or disconnect the cable.
9. Lift the test cell from the autoclave assembly. Guide the bottom transducer cable through the front panel of the instrument.

Cleaning the Test Cell

When the test cell has been cooled and removed from the autoclave, it should be cleaned according the following guidelines.

1. Place the test cell in a vice, topside up. Use the wrench flats and do not scratch or nick the cylinder or plugs.
2. Remove the top plug and pour off any standing water on the cement sample.
3. Remove the cell from the vice and replace in the vice topside down.
4. Unscrew and remove the bottom plug of the test cell.
5. Turn the cell over and drive the cement sample out of the test cell with a hammer.
6. Clean the cement and grease from the top and bottom plugs and cylinder with solvent.
7. When all traces of cement have been removed, grease the inner surfaces of the test cell, including the seal and O-rings.
8. Replace the O-rings if they were damaged during the test.
9. The instrument is now ready to run another test.
This page is intentionally left blank.
Section 3 – Maintenance

This section describes the basic maintenance that is required for the 5265 Autoclaves. A troubleshooting guide is also provided in the event that a problem occurs.

Maintenance

The 5265 Autoclave requires very little routine maintenance. Following the recommendations listed below will allow years of trouble free operation.

Tools Required

• 5/8” wrench
• 9/64” hex wrench
• Teflon tape
• Screwdriver
• Bench vise

Cleaning and Service Tips

• Keep all test cell surfaces exposed to cement coated with a thin layer of grease. This reduces the chance of corrosion and prevents cement from adhering to the metal.
• Keep cement off threads and out of the high-pressure ports on the top plug of the test cell.
• Lubricate the threads on the test cell plugs periodically with anti-seize lubricant.
• Thoroughly clean test cell of all cement immediately after each test.
• Keep the sensor faces and cavities inside each test cell plug clean and flat.
• Always apply a thin layer of acoustic couplant to the sensor after it has been removed.
• Always recheck the transit time, using the cal bar, after cleaning the sensor and replacing the couplant.

Calibration Procedure

The temperature controller may require periodic calibration after extended use. The procedures related to calibrating the controller are found in the Model 7050/7051 controller manual.

The instrument does not require calibration for the measurement of static gel strength. The values measured are absolute and there are no user accessible adjustments.

The measurement of transit time requires periodic calibration to ensure accurate measurements. The procedure is listed as follows:
1. Remove the cell from the instrument.
2. Thoroughly clean the cell in preparation for calibration.
3. Unscrew the bottom plug until the threads are approximately 1/2 engaged.
4. Insert the foam-centering sleeve for the calibration bar.
5. Apply a small amount of acoustic couplant to the ends of the 3.5-inch calibration bar.
6. Insert the calibration bar into the cylinder and press against the bottom plug.
7. Screw the top plug into the cylinder until it engages the calibration bar. Hand-tighten only.
8. Install the cylinder assembly into the instrument. Connect the top and bottom transducer cables.
9. Using the Data Acquisition Software, enter the UCA calibration section and update the calibration values. The specifics related to calibrating using the software may be found in the Model 5270 software manual.

Regulator Rebuild Instructions

Repair Kit Required: Chandler Part Number C09987 (Refer to the figure at the end of this section.)

Tools required:
- 5/16” Wide Screwdriver
- 1/2” Wide Screwdriver
- 1/2” Socket Wrench
- 1/2” Open End Wrench or Small Adjustable Wrench
- 1-3/4” Open End Wrench or Large Adjustable Wrench
- Needle Nose Pliers

The regulator is readily disassembled from the front panel.

*Note: All disassembly can be done WITHOUT removing the regulator from the instrument.*

**Major Disassembly**

1. Ensure all pressure is released from the instrument.
2. Rotate the regulator knob (Item 159) fully counterclockwise to remove tension from the regulator assembly.
3. Remove the hole plug (Item 155) from the regulator knob using the narrow (5/16” wide screwdriver) to pry the hole plug free.
4. Unscrew the nut (Item 153) from inside the regulator knob cavity using the 1/2” socket wrench.
5. Unscrew the bonnet (Item 151) using the 1-3/4” open end wrench. The bonnet will come off as an assembly: Bonnet (Item 151), adjusting screw (Item 160), collar (Item 002), limit screw (Item 158) and load spring (Item 006).
6. Items 161 and 162 do not exist in the stainless steel design. The bonnet (Item 151) is a closed end component as shown in detail (A).
7. Remove the sensor assembly from the body (Item 001) using the needle nose pliers to grip and pull the sensor from the regulator body. A rocking motion may be required to free the sensor assembly.
8. Unscrew the seat retainer (Item 004) from the body Item (001) and remove the seat (Item 003).
9. Clean the seat retainer.
10. Replace the seat (Item 003). Place the beveled (chamfered) side of the seat facing out toward the sensor assembly stem. (The seat should have the chamfer facing into the seat retainer thus the chamfer will face out when retained in the regulator body.)
11. Install the seat retainer with the seat back into the body. Use a small amount of anti-seize lubricant on the seat retainer threads.

**Bonnet Disassembly/Reassembly**

1. Remove the limit screw (Item 158) from the spring cap (Item 002).
2. Remove all components from the bonnet.
3. Clean and lubricate the bearing using a suitable lubricant.
4. Clean the spring cap and adjusting screw threads. Place a small amount of anti-seize lubricant on the threads.
5. Clean the spring.
6. Reassemble the bonnet components. Install the limit screw.
7. Set the bonnet assembly aside for later installation.

**Sensor Disassembly/Reassembly**

1. Unscrew the spring pad (Item 105) from the sensor (Item 102) using the 1/2” open end wrench and the large 1/2” wide screwdriver. You may wish to clamp the spring pad in a vise to perform this step.

   *Caution: Small parts are present within the sensor assembly. Take care not to lose the parts.*

2. Pull the spring pad away from the sensor. **Again, being careful not lose any parts!**
3. Retain the spacer (Item 106) for later use.
4. Remove the sensor components: Valve Stem (Item 101), Spring (Item 104), Spacer (Item 106), Seal (Item 007) and Sensor backup (Item 103).
5. Remove and replace the backup rings and O-rings (Items 051, 053, 052 and 054) using the new seals from the rebuild kit. Lubricate the O-rings with a suitable lubricant.
6. Replace the sensor internal components using the new internal components; Valve Stem (Item 101), Spring (Item 104) and Seal (Item 007).
7. Reuse and reinstall the original spacer (Item 106).
8. Reassemble the sensor pad, sensor backup and sensor. Place a small amount of anti-seize lubricant on the threads.
9. Discard all the used components.
**Major Assembly**

1. Place the sensor assembly back into the body (Item 001). Place a small amount of O-ring lubricant on the O-ring (Item 0052). Push the assembly into place using the needle nose pliers.
2. Screw the bonnet assembly with the spring into the body. Place a small amount of anti-seize lubricant on the threads.
3. Install the knob, nut and cover plug back on the regulator.
The following table lists symptoms of several common problems, the possible cause of the problem, and the possible solution to the problem.

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Cause</th>
<th>Possible Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAIN POWER circuit breaker switch trips off.</td>
<td>Short circuit in system wiring.</td>
<td>Disconnect power to instrument and check for short circuits with an ohmmeter.</td>
</tr>
<tr>
<td>Faulty MAIN POWER switch.</td>
<td></td>
<td>Replace switch.</td>
</tr>
<tr>
<td>Instrument not receiving power.</td>
<td>Instrument not plugged in.</td>
<td>Connect instrument to the correct power source.</td>
</tr>
<tr>
<td></td>
<td>Blown fuse or thrown breaker on circuit supplying power to the autoclave.</td>
<td>Check fuses and breakers on electrical supply circuit.</td>
</tr>
<tr>
<td>Pump will not operate.</td>
<td>Insufficient air pressure to pump.</td>
<td>Check air supply and make certain instrument is supplied with air between 75 and 125 psig. Check air lines for blockage. Adjust PUMP PRESSURE ADJUST regulator to a higher pressure.</td>
</tr>
<tr>
<td></td>
<td>Solenoid valve controlling flow of air to pump is not functioning.</td>
<td>If no solenoid click is heard when the PUMP switch is turned to the ON position, a faulty solenoid valve is likely.</td>

Scan Software Setup Instructions

A copy of Scan software is included with every 5270 DACS CD. The following are intended to help find and install the Scan software.

1. Insert the 5270 DACS CD into the CD player.
2. Click the “START” button located on the lower left of the Windows Desktop screen.
3. Click the “RUN” button.
4. Click the “BROWSE” button.
5. Using the pull down menu at the top, locate the drive containing the 5270 software CD.
6. Double click the “SCAN” folder.
7. Double click the “setup.exe” file.
8. Click the “OK” button and follow the install instructions.
9. The scan program is located at “C:\Program Files\Chandler Engineering – Scan”.
10. Add a shortcut on your desktop by opening the “Chandler Engineering – Scan” folder and right click the “Scan” icon. Highlight “Send To” and click “Desktop” (Create Shortcut).

NOTE: See the “HELP” menu for the online Scan Software Manual.
COMPONENTS

1. BNC CONNECTOR (TOP)
2. BNC CONNECTOR (MONITOR)
3. BNC CONNECTOR (SYNC)
4. 230V POWER RECEPT.
5. TYPE "J" THERMOCOUPLE RECEPT.
6. INSTRUMENT POWER RECEPTACLE
7. RS232/RS485 CONNECTIONS
8. COOLANT DRAIN CONNECTOR
9. COOLANT INLET CONNECTOR
10. AIR INLET CONNECTOR
11. PUMP WATER DRAIN CONNECTOR
12. PUMP WATER INLET CONNECTOR
13. HIGH PRESSURE INLET (OPTIONAL)
1. C08581 – RELIEF VALVE
2. P-2192 – RELIEF VALVE SHUT-OFF
3. C11293 – PRESSURE GAUGE
4. C15678 – TEMPERATURE CONTROLLER
5. P-1887 – PUMP PRESSURE ADJUST
6. 83-0026 – TRANSUDER CABLE RETURN
7. C06572 – PUMP PRESSURE GAUGE
8. C08587 – TRANSUDER CONNECT
9. P-2193 – PRESSURE RELEASE VALVE
10. C12161 – COOLANT SWITCH
11. C12161 – PUMP WATER SWITCH
12. C12161 – HEATER SWITCH
13. C12166 – PUMP SWITCH
14. P-3388 – 230V POWER SWITCH
15. P-2881 – INSTRUMENT POWER SWITCH
Declaration of Conformity

Manufacturer's Name: Chandler Instruments Company L.L.C.
Manufacturer's Address: 2001 North Indianwood Avenue
Broken Arrow, Oklahoma 74012 USA

Declares that the product:
Product Name: Model 5265 Static Gel Strength Analyzer
Model Number: 5265

Conform to the following standards:
EMC Directive 2004/108/EC:
- EN 61326-2-1 Conducted Emissions (Mains port)
- EN 61326-2-1 Radiated Emissions
- EN 61000-3-2 Harmonics
- EN 61000-3-3 Flicker
- EN 61000-4-2 Electrostatic Discharge, Criteria B
- EN 61000-4-3 Radiated Electromagnetic Field, Criteria A
- EN 61000-4-4 Electrical Fast Transients / Burst, Criteria B
- EN 61000-4-5 Surge Immunity, Criteria B
- EN 61000-4-6 RF Conducted Immunity, Criteria A
- EN 61000-4-8 Magnetic Immunity, Criteria A
- EN 61000-4-11 Voltage dips and Interruptions, Criteria B

Low Voltage Directive 2006/95/EC:
- EN 61010-1 Safety Requirements for Electrical Equipment for Measurement, Control, and Laboratory Use

Machinery Directive 98/37/EC:

PED Directive 97/23/EC:
Conformity Assessment
Type: Pressure Equipment
Category: III
Module: H
Notified Body: HPiVS Ltd
The Manor House
Howbery Park, Wallingford
OX10 8BA, United Kingdom
Identification No. 1521

STATIC GEL STRENGTH ANALYZER

A Breakthrough Tool for Oil Well Cement Testing

Gas migration and water flows through cement are two of the biggest problems facing the petroleum industry. One of the critical measurements required to evaluate the potential for fluid inflow migration problems is the determination of the static gel strength development of the cement slurry.

A breakthrough instrument, the Model 5265 SGSA simultaneously measures both a slurry’s compressive strength development and its static gel strength development while it is cured under downhole temperature and pressure conditions.

A Powerful, Proven Technique

Similar to a standard ultrasonic cement analyzer, the cement’s properties are inferred by measuring the change in the energy level of an ultrasonic signal transmitted through the cement specimen as it cures. Proven through actual laboratory testing, the proprietary algorithms developed by Chandler Engineering for static gel strength measurement are applicable to a wide range of cement slurry densities and compositions including light weight, heavy weight and latex slurries.

Operational Simplicity

The cement slurry to be tested is prepared in accordance with API recommendations, then placed in the unit’s temperature and pressure-controlled cell which simulates the curing conditions that are expected downhole. During testing, temperature is automatically controlled while pressure is manually set.

FEATURES

- Real-Time Measurement of Gel Strength Development
- Real-Time Measurement of Compressive Strength Development
- Used to predict WOC time
- Used to predict gas & water migration susceptibility
- Non-Destructive Method
- Uses Proven Algorithms
- Chandler Engineering Model 5720 Data Acquisition Software
Model 5265

The acoustic measurements are read by a unique system of sensors and electronics which automatically perform the complex calculations. All test data and results are then transferred to a computer that is running the Chandler Engineering Model 5270 Data Acquisition software. The software produces real-time graphs of the test results which can be printed at any point during the testing.

**Specifications**

**Maximum Temperature**
400°F (204°C)

**Maximum Pressure**
20,000 psi (138 MPa)

**Heater Power**
2000 Watts

**Environmental Operating Temperature**
60°F - 122°F (16°C - 50°C)

**Utilities**

- **Mains**
  208 - 240 VAC, 10A, 50/60 Hz, 1 Phase

- **Water**
  Clean pressurized water; 20-80 psi (138-552 kPa)

- **Coolant**
  Clean water or ethylene glycol solution

- **Air**
  Clean dry compressed air; 50-100 psi (340-690 kPa)

- **Drain**
  Suitable for hot water

Manufacturer’s specifications subject to change without notice
All products of Chandler Engineering are warranted for a period of one year from date of shipment to be free from defective workmanship and material. Providing written notice is made and authorization by us is given, any of our products claimed to be defective may be returned freight prepaid to our factory. If found to be defective and after examination by us, our obligation will be limited to repairing or replacing the product, at our option, free of charge, F.O.B. our factory.

COMMERCIAL INSTRUMENTATION MANUFACTURED BY OTHERS

Commercial instrumentation manufactured by others is covered by separate manufacturer warranty, generally for one year. Contact Chandler Engineering for instructions on obtaining service directly from the manufacturer.

Our warranty does not cover damage or failure caused by abuse, misuse, abnormal usage, faulty installation, improper maintenance, or any repairs other than those provided by authorized Chandler Engineering personnel.

This warranty is in lieu of all other warranties, expressed or implied, and of all obligations or liabilities on its part for damages including but not limited to consequential damages, following the use or misuse of instruments manufactured by Chandler Engineering Company L.L.C.

NO WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE SHALL APPLY.

Our total liability on any claim shall not exceed the price allocable to the product or service or part thereof that gives rise to the claim.
